1. Configure the extension

Blog Pro has many options and settings that will be useful to you while creating blog posts.

To configure the extension, go to **System → Configuration → Blog Pro** or **CMS → Blog Pro → Configuration**.

The page contains 18 sections, which are described below; the interface is very intuitive to make the configuration process easier for you.

2. Top/Footer Menu Integration

Blog Pro

Save Config

Top Menu Integration	
Display	Yes
Label	Blog
Position	1

It's possible to add the blog link to the top menu of your store.

Display

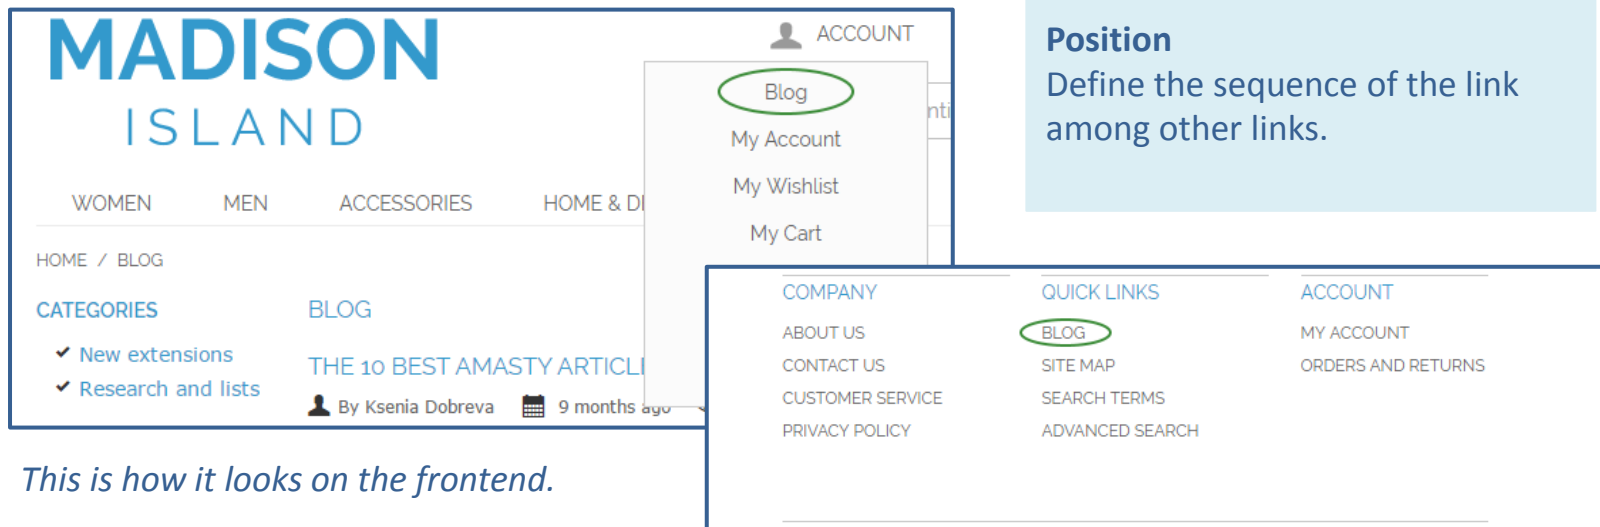

Display or hide the blog link in the top menu.

Label

Specify the label of the link.

Position

Define the sequence of the link among other links.

This is how it looks on the frontend.

With an identical set of settings you can add a quick link to your blog to the footer menu.

User Guide: [Blog Pro](#)

Support: <http://amasty.com/contacts/>

The screenshot shows the 'Blog Pro' configuration window with a 'Save Config' button in the top right. The 'Search Engine Optimization' section is active, displaying five input fields: 'Route' (blog), 'Title Prefix for Blog Pro' (Mystore.com), 'Meta Title for Blog Pro' (Store Blog), 'Meta Keywords for Blog Pro' (e-commerce, shopping, online business), and 'Meta Description for Blog Pro' (Useful articles for business owners. Here you will find everything you need to know about e-commerce.).

Search Engine Optimization	
Route	blog
Title Prefix for Blog Pro	Mystore.com
Meta Title for Blog Pro	Store Blog
Meta Keywords for Blog Pro	e-commerce, shopping, online business
Meta Description for Blog Pro	Useful articles for business owners. Here you will find everything you need to know about e-commerce.

Blog Pro allows you to optimize the blog for Google and other search engines. Carefully picked meta title, keywords, and description will boost your blog in search results and attract more potential customers to the store.

Route - Define the URL title, which will redirect visitors to your blog page.

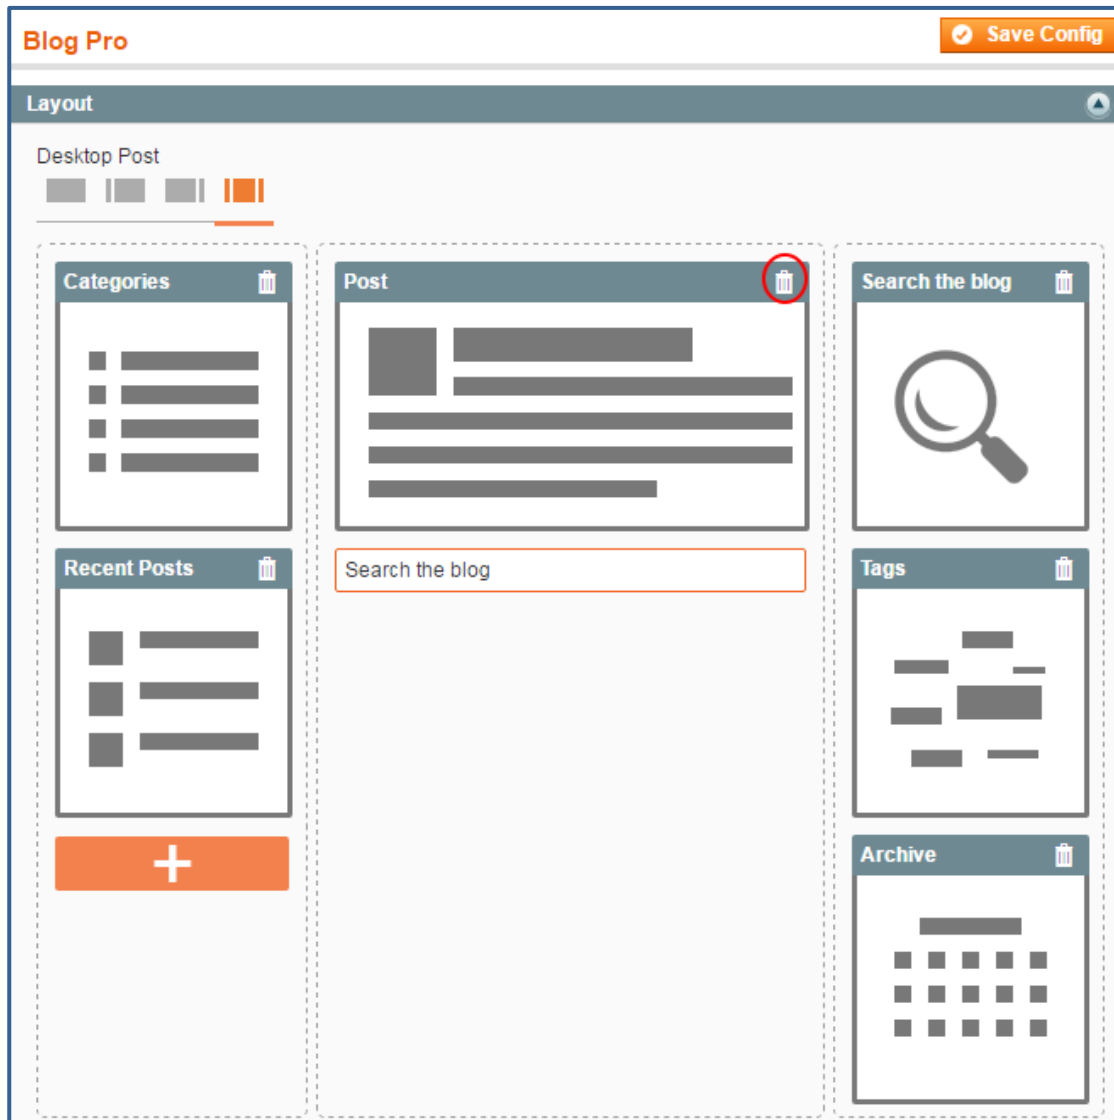

Title Prefix for Blog Pro - Indicate the default prefix that would be displayed in a browser tab when you open a blog category or search for a tag.

Meta Title for Blog Pro - This is the title of the main blog page in a browser tab.

Meta Keywords for Blog Pro - Add the keywords by which customers can find your blog. Try to find words and phrases, which are relevant to the topics that are covered in your blog.

Meta Description for Blog Pro - This description is displayed in search engines results.

4. Layout

With the help of this layout constructor, you can define how blocks with different blog information would be displayed on the frontend. There are four layout types: *desktop layouts for the main blog page and for a post page, and the same layouts for mobile devices.*

The configuration is easy and convenient since all the layout blocks are visualized. You can *drag, add, delete,* and interchange the position of the blocks as you need. To add a block, click the *Plus* button and select one of the available variants. If you want to delete a block, please click the basket icon in its upper right corner.

4. Layout

magento

ARCHIVES

✓ January 2016

A sample of a particular post page.

Define the quantity of posts displayed on one blog page and specify the type of search, that should be used for the blog.

The screenshot shows the 'Blog Pro' configuration window. At the top right is a 'Save Config' button. Below it are two sections: 'List' and 'Search'. The 'List' section has a 'Number of Posts per Page' input field with the value '10'. The 'Search' section has a 'Search Type' dropdown menu with three options: 'Built in Engine' (selected), 'MySql Like', and 'Built in Engine' (highlighted in blue).

Number of Posts per Page - Set how many posts should be displayed on the main blog page. If there are more posts in your blog, customers can switch the pages with the **Older Entries** link

Search Type - Define the type of search that should be used in your store. Three different options are available: *Built-in search engine* is preselected by default. It's a resourceful but powerful solution; offers synonyms to the customer's search request; *MySQL LIKE Search* is the fastest type of search that works with the exact matches. If visitors are mostly searching your store for particular models, this type of search would be the most suitable; *Full text Search* uses MYSQL algorithms; corrects typos automatically (available only with MySQL 5.6.2 and higher).

Specify the general settings that would be applied to all articles in the blog.

The screenshot shows the 'Blog Pro' configuration interface. At the top right is a 'Save Config' button with a checkmark icon. Below it is a 'Post' section with a list of settings:

Post	
Display Author Name	Yes ▼
Display Number of Views	Yes ▼
Display Print Link	Yes ▼
Display Categories	Yes ▼
Display Tags	Yes ▼
Date Format	6 days ago ▼

Display Author Name - Select Yes if you want to display the name of the post author on the frontend.

Display Number of Views - Enable this option to display a number of visitors who have already viewed a post.

Display Print Link - Set to Yes to allow customers print a post.

Display Categories - Enable the option to display categories a post belongs to.

Display Tags - Enable this option to display the tags related to a post topic. Due to tags, customers will be able to find all articles with the same topic.

Date Format - Decide how to display the publishing date: in the standard format or as the number of days passed from publishing.

Define how blog URLs and redirect links should be formed.

Blog Pro

✓ Save Config

URLs and Redirects

URL Postfix	<input type="text" value=".html"/>
Redirect to SEO formatted URL	<input type="text" value="Yes"/>

URL Postfix - The HTML postfix shows search engines that the page is static, and, therefore, is reliable.

Redirect to SEO formatted URL - If you enable this option, customers and search robots will be redirected to a SEO-friendly post page by 301 redirect.

Visitors' comments and discussions are a very important part of a successful blog. In this section you can define how they should be managed by default.

Blog Pro Save Config

Comments	
Use Comments	<input type="text" value="Yes"/>
Automatic Approving	<input type="text" value="No"/>
Allow Guest Comments	<input type="text" value="Yes"/>
Quantity of Recent Comments in Block	<input type="text" value="5"/>
Display Short Content for Recent Comments	<input type="text" value="Yes"/>
Display Date for Recent Comments	<input type="text" value="Yes"/>
Attribute rel="nofollow" for Links in Comment	<input type="text" value="Yes"/>

Use Comments - Enable or disable readers' comments on the frontend.

Automatic Approving - Select *Yes* if you want to publish comments without admin approval; they will appear on the post page immediately.

Allow Guest Comments - Enable the option to allow non-registered customers to comment your posts.

Choose how the latest posts should appear in the block.

Recent Posts Quantity in Block - Define the quantity of posts that will be displayed in the block.

Display Short Content - Select Yes to allow your customers to read the beginning of posts.

Display Date - Select Yes to show the date when a post was published.

Short Content Limit - Define the number of symbols that will be displayed in the block for each post.

User Guide: [Blog Pro](#)

Support: <http://amasty.com/contacts/>

10. Tags

Tags are more specific than categories and help merchants to describe their posts in more detail. Due to tags, customers are able to find posts with the topic they are interested in quicker.

Blog Pro

Tags

Minimal Posts Number per Tag

1

Use 3D Cloud to Display Tags

Yes

3D Cloud: Height

300

3D Cloud: Color Scheme

Select one and press Apply

Apply

▲ Choose any color scheme and press Apply to fill color fields automatically

3D Cloud: Text Color

111111

3D Cloud: Tag Color for Less Used Tags

297AA3

3D Cloud: Tag Highlight Color

111111

You can use a handy palette instead of the HEX codes to get the exact colors you need. The palette will appear as a dropdown for every field that requires a particular color

Minimal Posts Number per Tag - Define the minimal quantity of posts that a tag should have.
Use 3D Cloud to Display Tags - To make tags more noticeable to customers, you can add a block with a 3D tag cloud to the main blog page and all post pages.

3D Cloud: Height - Define the height of the 3D cloud block.

3D Cloud: Color Scheme - Choose the color scheme of the cloud that will suit your store design.

3D Cloud: Text Color - Input the HEX code of the color that will be applied to most popular tags (they have bigger size than other tags).

3D Cloud: Tag Color for Less Used Tags - Input the HEX code of the color that will be applied to minor tags (they are smaller than the popular ones).

3D Cloud: Tag Highlight Color - Input the HEX code of the tag highlight color.

26. Comments Management

 LEAVE A COMMENT

James K 9 months ago at 7:26 AM

A good comprehensive guide. We are currently looking at moving to full SSL site-wide in Magento, this was done relatively easily with a server redirect however we found that Magento still submitted forms (for product options) over non-secure connections, meaning the products could not be added to the basket. Something I am still trying to fix!

Comments is a necessary part of every blog. With their help, you can communicate with your customers and learn their opinion on the topics you cover.

To manage the existing comments, go to
CMS → Blog Pro → Comments backend page.

The Blog Pro extension allows you to insert five types of widgets with blog content into the pages of your store.

Recent Posts

The first widget is Recent Posts. It displays your recent posts with thumbnails and short content of posts (optional).

The widget frontend view:

Here is the description of the widget options:

- 1) Category: Select a category which posts will be displayed in the widget. You can display posts from all categories as well.
- 2) Type: Choose if the widget will be integrated into a sidebar or into the content area.
- 3) Display Short Content: Select Yes if you want to show the beginning of posts in the block.
- 4) Display Date: Select Yes to display the date of post publishing.
- 5) Posts Limit: Define the number of posts that will be shown in the widget.

Tagged Posts

The Tagged Posts widget contains posts with tags which you can specify in the widget settings. This widget is especially useful for product and category pages (e.g. widget with the “hats” tag for the Hats category).

- 2) Archives Limit to Display: Define the number of the last months that will be displayed in the widget.

Integration into a Product Page

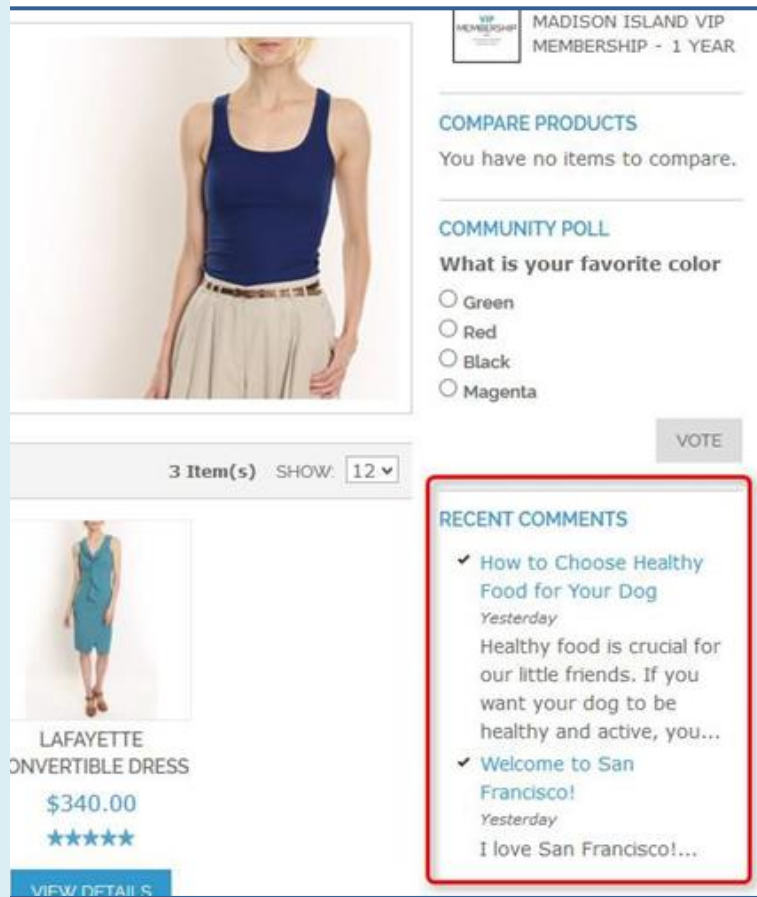

If you want to integrate a **Blog Pro widget** into a category page, it is better to do by creating a new widget. For instance, we will insert the Recent Comments widget into the New Arrivals category (into the right column).

Head to the **CMS → Widgets** backend page and click the Create New Widget Instance button. Before setting the widget options in the backend, you should create a widget. To learn how to create a widget, read this Magento instruction: http://docs.magento.com/m1/ce/user_guide/cms/widget-create.html

After you created the widget, go to the Widget Options tab. The process of setting the widget options is described in the Recent Comments widget section. When the widget is ready, click the Save button.

Note: Don't forget to clear the cache to enable the changes in the frontend.

The widget is inserted into the New Arrivals category:

If necessary, you can insert a widget into a product page. For instance, you can integrate the Tagged Posts widget with the tag that is relevant to a product.

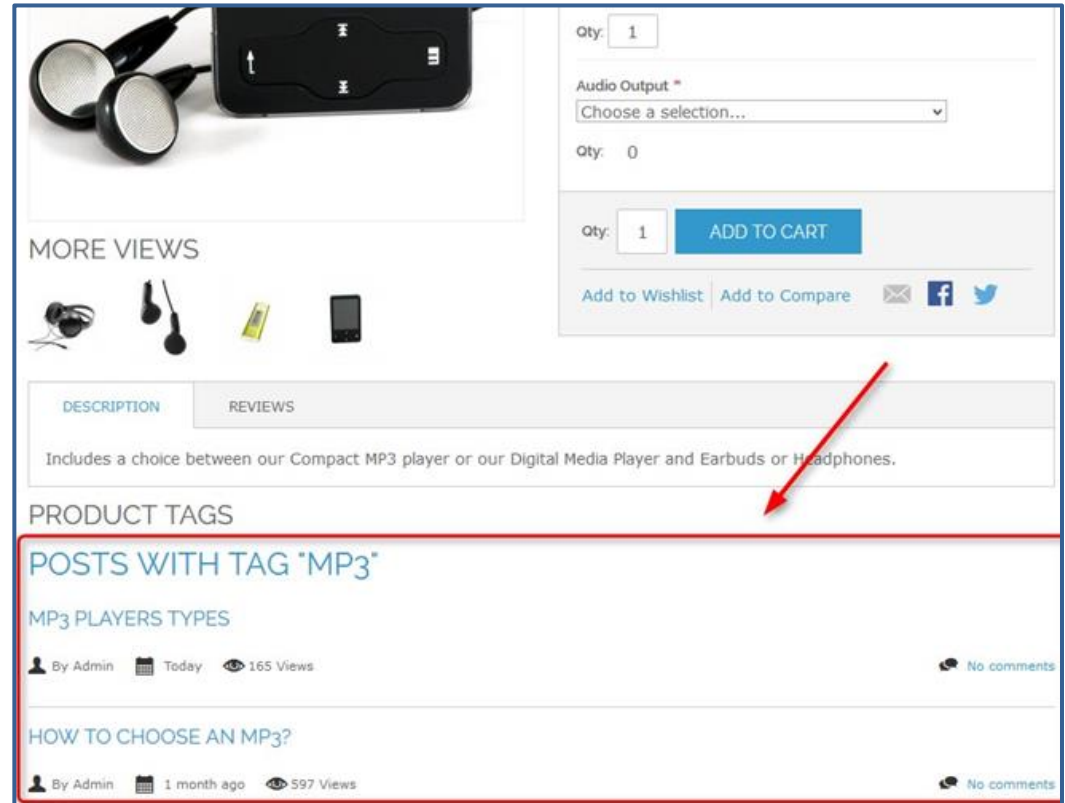

As an example, we will integrate the Tagged Posts widget into the MP3 Player page.

Go to the **CMS → Widgets** backend page. You can find the description of creating and setting the Tagged Posts widget in this section.

After the widget is created, click the Save button.

Note: Don't forget to clear the cache to enable the changes in the frontend.

The widget is inserted into the product page:

Integration into a CMS Page

You can display widgets not only on the product and category pages, but also on the Home Page, About Us, and other CMS pages in the store.

In our case, the **Recent Posts** widget will be inserted into the Home Page.

Navigate to the **CMS → Pages** backend page and choose the page where you want to integrate it. Then, navigate to the Content tab.

To insert the widget, choose the necessary place and click the Insert Widget button.

    <li>
      <a href="{{config path="web/secure/base_url"}}accessories/bags-luggage.html">
        
    </li>
  </ul>
```

In the opened window, select the necessary widget type.

After that, a new Widget Options section appears and you need to set the Recent Posts widget options.

The screenshot shows a 'Widget Insertion' dialog box with the following sections:

- Widget**
 - Widget Type *: Blog Pro: Recent Posts (dropdown menu)
 - Select a category filter for posts.
- Widget Options**
 - Category *: All Categories (dropdown menu)
 - Type *: Sidebar (dropdown menu)
 - Display Short Content *: No (dropdown menu)
 - Display Date *: No (dropdown menu)
 - Posts Limit *: 3 (text input)

Below the dialog box, there is a dark gray area with two lines of code:

```
alt="Shop Private Sales - Members Only" />  
alt="Travel Gear for Every Occasion" />
```

30. Widget Integration Examples

The screenshot displays a website layout. On the left, a sidebar contains a 'COMPANY' menu with links: ABOUT US, CONTACT US, CUSTOMER SERVICE, and PRIVACY POLICY. Below this is a 'POPULAR TAGS' section with tags: grey, shirt, suit, white, and a 'View All Tags' link. A red arrow points from the 'View All Tags' link to a 'RECENT POSTS' widget. The main content area features a large advertisement for 'WING MAN' with the text 'hit the runway in stylish separates and cauals' and a 'SHOP MEN' button. The 'RECENT POSTS' widget shows two posts. The first post is titled 'MP3 PLAYERS TYPES' and includes a 'READ MORE' button. The second post is titled 'WELCOME TO SAN FRANCISCO!'.

WELCOME TO SAN FRANCISCO!

By Admin 2 days ago 214 Views

When all the options are set, click the Insert Widget button.

Then, click the Save button.

Note: Don't forget to clear the cache to enable the changes in the frontend.
The Recent Posts widget is inserted into the

Home Page:

The screenshot shows the 'Edit Block' interface for a CMS. The top navigation bar includes 'Dashboard', 'Sales', 'Catalog', 'Mobile', 'Customers', 'Promotions', 'Newsletter', 'CMS' (highlighted), 'Reports', and 'System'. Below the navigation bar, the title 'Edit Block 'Home & Decor'' is displayed, followed by 'Back', 'Reset', 'Delete Block', and 'Save Block' buttons. The main section is titled 'General Information' and contains the following fields:

- Block Title ***: Home & Decor
- Identifier ***: home-decor
- Store View ***: A dropdown menu showing 'All Store Views', 'Main Website', 'Madison Island', 'English' (selected), 'French', and 'German'.
- Status ***: Enabled
- Content ***: A text area containing HTML code: `<li style="display: block; float: left; height: 100px; margin: 10px 0; width: 295px; text-align: center; background: non-direct_url="home-decor.html"]}><strong style="display: block; font-size: 24px; font-weight: 500; letter-spacing: 11px;`

Below the content field, there are four buttons: 'Show / Hide Editor', 'Insert Widget...', 'Insert Image...', and 'Insert Variable...'.

Integration into a CMS Static Block

The extension allows inserting a widget into CMS static blocks, such as Footer Links, 404 page, etc. To insert a widget into a CMS block, go to the **CMS → Static Block** backend page and choose a block where you want to insert your widget.

To insert the widget, choose the necessary place in the code and click the Insert Widget button.
