1. GeoIP Redirect settings

Databases are needed for the correct work of GeoIp Redirect module. Please download the necessary files from Amasty or from your own source.

To add the files, please go to Stores->Configuration-> Geo Ip Data

The screenshot shows the Amasty configuration interface for GeoIP Redirect. On the left is a sidebar with navigation options: PRODUCTS, CUSTOMERS, MARKETING, CONTENT, REPORTS, STORES, SYSTEM, and FIND PARTNERS & EXTENSIONS. The main content area is titled 'AMASTY EXTENSIONS' and 'Download and Import'. It features a 'Download and Import' button and a progress bar with three stages: 'Download' (empty circle), 'Import' (green checkmark), and 'Completed' (green checkmark). Below this is an 'Import' section with an 'Import' button and a list of files: 'var/amasty/geoip/GeoLite2-City-Blocks-IPv4.csv' and 'var/amasty/geoip/GeoLite2-City-Locations-en.csv', both with green checkmarks. A progress bar for the import process shows 'Import' (empty circle) and 'Completed' (green checkmark). The text 'Last Imported: 2015-12-09 12:07:10' is displayed at the bottom.

Press Download and Import, to make the extension download the updated sql dump file and import it into your database.

NOTE: In the Download and Import mode, don't be misled by the error notification in the Import section, on the absence of csv files: the csv files are not needed, and the import will proceed.

To import the files from your own source, use import option . Path to the files should look like this. Replace the selected part with your folders' names.

NOTE: In the Import section, the button Import is grayed out by default. It will be available right after you upload the csv files. The red error notification will switch to green success notification - the import is completed.

1. GeoIP Redirect settings

To configure the extension please go to Stores -> Configuration -> GeoIp Redirect
